

Multi - Operative

Introducing a new way to assign and manage your Job Requests, Quadpro's Multi-Operative feature provides the ability to assign any Job Request to up to four different operatives.

We recognised that this feature would offer an enhanced way to manage Job Requests that need more than one pair of hands to complete.

How does it work?

When a new Job Request arrives into your Quadpro system, you just need to assign it to the "lead operative" and then choose up to three other operatives who will be working on the Job Request.

If you choose not to use more than one assigned Operative in a Job Request, you can continue as you normal to use the Job Request module.

Each Operative can write up information on their part of the work and mark it as completed. Any information entered by additional Operatives will then be stored in that Job Request record.

All information submitted by the additional operatives is stored against the Job Request record and is accessible in the Web Portal and the Desktop system.
